

Objectives

After completing this lesson, you should be able to do the following:

- Write SELECT statements to access data from more than one table using equijoins and nonequijoins
- · Join a table to itself by using a self-join
- View data that generally does not meet a join condition by using outer joins
- Generate a Cartesian product of all rows from two or more tables

ORACLE

6 - 2

Copyright © 2007, Oracle. All rights reserved.

Objectives

This lesson explains how to obtain data from more than one table. A *join* is used to view information from multiple tables. Therefore, you can *join* tables together to view information from more than one table.

Note: Information on joins is found in the section on *SQL Queries and Subqueries: Joins* in *Oracle Database SQL Language Reference 11g, Release 1 (11.1).*

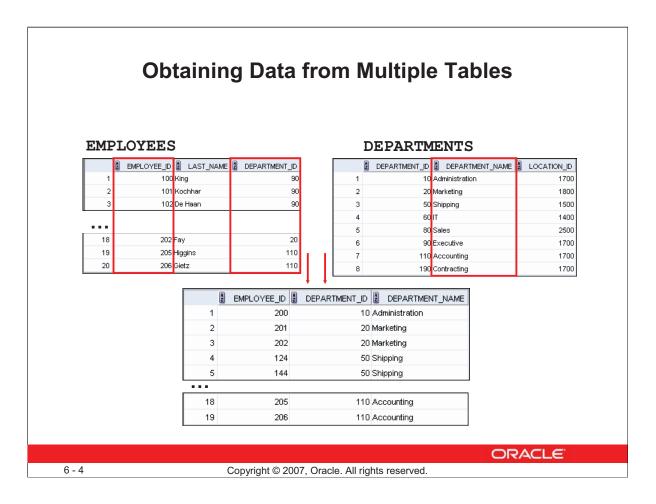

Lesson Agenda

- Types of JOINS and its syntax
- Natural join:
 - USING clause
 - ON clause
- Self-join
- Nonequijoins
- OUTER join:
 - LEFT OUTER join
 - RIGHT OUTER join
 - FULL OUTER join
- Cartesian product
 - Cross join

ORACLE

6 - 3

Copyright © 2007, Oracle. All rights reserved.

Obtaining Data from Multiple Tables

Sometimes you need to use data from more than one table. In the example in the slide, the report displays data from two separate tables:

- Employee IDs exist in the EMPLOYEES table.
- Department IDs exist in both the EMPLOYEES and DEPARTMENTS tables.
- Department names exist in the DEPARTMENTS table.

To produce the report, you need to link the EMPLOYEES and DEPARTMENTS tables, and access data from both of them.

Types of Joins

Joins that are compliant with the SQL:1999 standard include the following:

- Natural joins:
 - NATURAL JOIN clause
 - USING clause
 - ON clause
- Outer joins:
 - LEFT OUTER JOIN
 - RIGHT OUTER JOIN
 - FULL OUTER JOIN
- Cross joins

ORACLE

6 - 5

Copyright © 2007, Oracle. All rights reserved.

Types of Joins

To join tables, you can use a join syntax that is compliant with the SQL:1999 standard.

Note: Before the Oracle9*i* release, the join syntax was different from the American National Standards Institute (ANSI) standards. The SQL:1999–compliant join syntax does not offer any performance benefits over the Oracle-proprietary join syntax that existed in the prior releases. For detailed information about the proprietary join syntax, see Appendix C: Oracle Join Syntax.

Note: The following slide discusses the SQL:1999 join syntax.

Joining Tables Using SQL:1999 Syntax

Use a join to query data from more than one table:

```
SELECT table1.column, table2.column

FROM table1

[NATURAL JOIN table2] |

[JOIN table2 USING (column_name)] |

[JOIN table2

ON (table1.column_name = table2.column_name)]|

[LEFT|RIGHT|FULL OUTER JOIN table2

ON (table1.column_name = table2.column_name)]|

[CROSS JOIN table2];
```

ORACLE

6 - 6

Copyright © 2007, Oracle. All rights reserved.

Joining Tables Using SQL:1999 Syntax

In the syntax:

table1.column denotes the table and the column from which data is retrieved

 ${\tt NATURAL\ JOIN\ joins\ two\ tables\ based\ on\ the\ same\ column\ name}$

JOIN table2 USING column_name performs an equijoin based on the column name

JOIN table2 ON table1.column_name = table2.column_name performs an equijoin based on the condition in the ON clause

LEFT/RIGHT/FULL OUTER is used to perform outer joins

CROSS JOIN returns a Cartesian product from the two tables

For more information, see the section titled SELECT in Oracle Database SQL Language Reference 11g, Release 1 (11.1).

Qualifying Ambiguous Column Names

- Use table prefixes to qualify column names that are in multiple tables.
- Use table prefixes to improve performance.
- Instead of full table name prefixes, use table aliases.
- Table alias gives a table a shorter name:
 - Keeps SQL code smaller, uses less memory
- Use column aliases to distinguish columns that have identical names, but reside in different tables.

ORACLE

6 - 7

Copyright © 2007, Oracle. All rights reserved.

Qualifying Ambiguous Column Names

When joining two or more tables, you need to qualify the names of the columns with the table name to avoid ambiguity. Without the table prefixes, the <code>DEPARTMENT_ID</code> column in the <code>SELECT</code> list could be from either the <code>DEPARTMENTS</code> table or the <code>EMPLOYEES</code> table. It is necessary to add the table prefix to execute your query. If there are no common column names between the two tables, there is no need to qualify the columns. However, using the table prefix improves performance, because you tell the Oracle server exactly where to find the columns.

However, qualifying column names with table names can be time consuming, particularly if the table names are lengthy. Instead, you can use *table aliases*. Just as a column alias gives a column another name, a table alias gives a table another name. Table aliases help to keep SQL code smaller, therefore using less memory.

The table name is specified in full, followed by a space and then the table alias. For example, the EMPLOYEES table can be given an alias of e, and the DEPARTMENTS table an alias of d.

Guidelines

- Table aliases can be up to 30 characters in length, but shorter aliases are better than longer ones.
- If a table alias is used for a particular table name in the FROM clause, then that table alias must be substituted for the table name throughout the SELECT statement.
- Table aliases should be meaningful.
- The table alias is valid for only the current SELECT statement.

Oracle Database 11g: SQL Fundamentals I 6 - 7

Lesson Agenda

- Types of JOINS and its syntax
- Natural join:
 - USING clause
 - ON clause
- Self-join
- Nonequijoins
- OUTER join:
 - LEFT OUTER join
 - RIGHT OUTER join
 - FULL OUTER join
- Cartesian product
 - Cross join

ORACLE

6 - 8

Copyright © 2007, Oracle. All rights reserved.

Creating Natural Joins

- The NATURAL JOIN clause is based on all columns in the two tables that have the same name.
- It selects rows from the two tables that have equal values in all matched columns.
- If the columns having the same names have different data types, an error is returned.

ORACLE

6 - 9

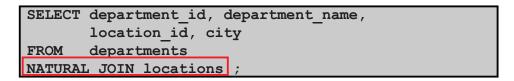

Copyright © 2007, Oracle. All rights reserved.

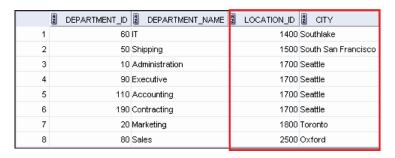

Creating Natural Joins

You can join tables automatically based on the columns in the two tables that have matching data types and names. You do this by using the NATURAL JOIN keywords.

Note: The join can happen on only those columns that have the same names and data types in both tables. If the columns have the same name but different data types, then the NATURAL JOIN syntax causes an error.

Retrieving Records with Natural Joins

6 - 10 Copyright © 2007, Oracle. All rights reserved.

Retrieving Records with Natural Joins

In the example in the slide, the LOCATIONS table is joined to the DEPARTMENT table by the LOCATION_ID column, which is the only column of the same name in both tables. If other common columns were present, the join would have used them all.

Natural Joins with a WHERE Clause

Additional restrictions on a natural join are implemented by using a WHERE clause. The following example limits the rows of output to those with a department ID equal to 20 or 50:

```
SELECT department_id, department_name, location_id, city

FROM departments
NATURAL JOIN locations
WHERE department id IN (20, 50);
```

Creating Joins with the USING Clause

- If several columns have the same names but the data types do not match, natural join can be applied using the USING clause to specify the columns that should be used for an equijoin.
- Use the USING clause to match only one column when more than one column matches.
- The NATURAL JOIN and USING clauses are mutually exclusive.

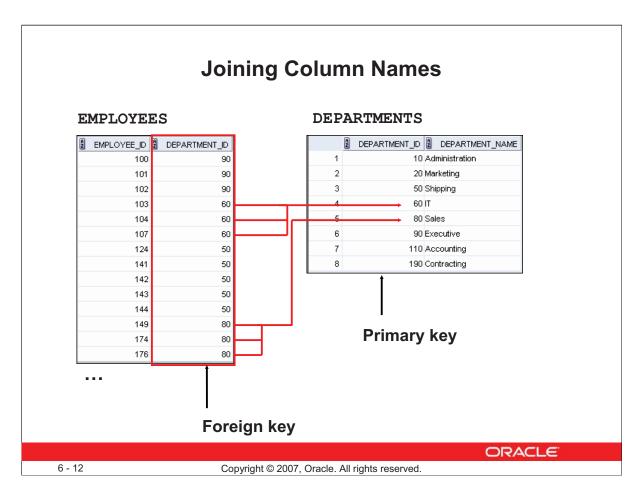

ORACLE

6 - 1′

Copyright © 2007, Oracle. All rights reserved.

Creating Joins with the USING Clause

Natural joins use all columns with matching names and data types to join the tables. The USING clause can be used to specify only those columns that should be used for an equijoin.

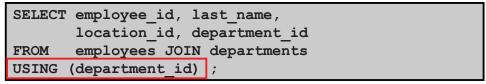

Joining Column Names

To determine an employee's department name, you compare the value in the <code>DEPARTMENT_ID</code> column in the <code>EMPLOYEES</code> table with the <code>DEPARTMENT_ID</code> values in the <code>DEPARTMENTS</code> table. The relationship between the <code>EMPLOYEES</code> and <code>DEPARTMENTS</code> tables is an <code>equijoin</code>; that is, values in the <code>DEPARTMENT_ID</code> column in both the tables must be equal. Frequently, this type of join involves primary and foreign key complements.

Note: Equijoins are also called *simple joins* or *inner joins*.

Retrieving Records with the USING Clause

	A	EMPLOYEE_ID	LAST_NAME	A	LOCATION_ID	DEPARTMENT_ID
1		200	Whalen		1700	10
2		201	Hartstein		1800	20
3		202	Fay		1800	20
4		124	Mourgos		1500	50
5		144	Vargas		1500	50
6		143	Matos		1500	50
7		142	Davies		1500	50
8		141	Rajs		1500	50
9		107	Lorentz		1400	60
10		104	Ernst		1400	60
19		205	Higgins		1700	110

6 - 13 Copyright © 2007, Oracle. All rights reserved.

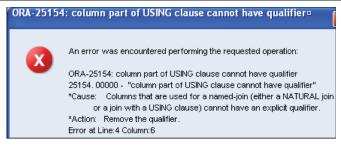

Retrieving Records with the USING Clause

In the example in the slide, the <code>DEPARTMENT_ID</code> columns in the <code>EMPLOYEES</code> and <code>DEPARTMENTS</code> tables are joined and thus the <code>LOCATION_ID</code> of the department where an employee works is shown.

Using Table Aliases with the USING Clause

- Do not qualify a column that is used in the USING clause.
- If the same column is used elsewhere in the SQL statement, do not alias it.

```
SELECT l.city, d.department_name
FROM locations l JOIN departments d
USING (location_id)
WHERE d.location_id = 1400;
```

6 - 14

Copyright © 2007, Oracle. All rights reserved.

ORACLE

Using Table Aliases with the USING clause

When joining with the USING clause, you cannot qualify a column that is used in the USING clause itself. Furthermore, if that column is used anywhere in the SQL statement, you cannot alias it. For example, in the query mentioned in the slide, you should not alias the location_id column in the WHERE clause because the column is used in the USING clause.

The columns that are referenced in the USING clause should not have a qualifier (table name or alias) anywhere in the SQL statement. For example, the following statement is valid:

```
SELECT l.city, d.department_name
FROM locations l JOIN departments d USING (location_id)
WHERE location_id = 1400;
```

Because, other columns that are common in both the tables, but not used in the USING clause, must be prefixed with a table alias otherwise you get the "column ambiguously defined" error.

In the following statement, manager_id is present in both the employees and departments table and if manager_id is not prefixed with a table alias, it gives a "column ambiguously defined" error.

The following statement is valid:

```
SELECT first_name, d.department_name, d.manager_id
FROM employees e JOIN departments d USING (department_id)
WHERE department id = 50;
```

Creating Joins with the ON Clause

- The join condition for the natural join is basically an equijoin of all columns with the same name.
- Use the ON clause to specify arbitrary conditions or specify columns to join.
- The join condition is separated from other search conditions.
- The ON clause makes code easy to understand.

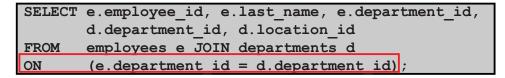

5 Copyright © 2007, Oracle. All rights reserved.

6 - 15

Creating Joins with the ON Clause

Use the ON clause to specify a join condition. With this, you can specify join conditions separate from any search or filter conditions in the WHERE clause.

	2 EMPLO	YEE_ID	LAST_NAME	2 DEPARTMENT_ID 2	DEPARTMENT_ID_1	LOCATION_ID
1		200 V	Whalen	10	10	1700
2		201 F	lartstein	20	20	1800
3		202 F	ay	20	20	1800
4		124 N	Mourgos	50	50	1500
5		144 \	/argas	50	50	1500
6		143 N	Matos	50	50	1500
7		142 D	avies	50	50	1500
8		141 F	Rajs	50	50	1500
9		107 L	orentz.	60	60	1400
10		104 E	irnst	60	60	1400

• • • •

6 - 16

Copyright © 2007, Oracle. All rights reserved.

ORACLE

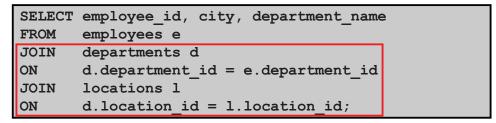

Retrieving Records with the ON Clause

In this example, the <code>DEPARTMENT_ID</code> columns in the <code>EMPLOYEES</code> and <code>DEPARTMENTS</code> table are joined using the <code>ON</code> clause. Wherever a department ID in the <code>EMPLOYEES</code> table equals a department ID in the <code>DEPARTMENTS</code> table, the row is returned. The table alias is necessary to qualify the matching <code>column names</code>.

You can also use the ON clause to join columns that have different names. The parenthesis around the joined columns as in the slide example, (e.department_id = $d.department_id$) is optional. So, even ON e.department id = d.department id will work.

Note: SQL Developer suffixes a '1' to differentiate between the two department ids.

Creating Three-Way Joins with the ON Clause

	EMPLOYEE_ID	2 CITY	DEPARTMENT_NAME
1	100	Seattle	Executive
2	101	Seattle	Executive
3	102	Seattle	Executive
4	103	Southlake	IT
5	104	Southlake	IT
6	107	Southlake	IT
7	124	South San Francisco	Shipping
8	141	South San Francisco	Shipping

• • •

6 - 17

ORACLE

Creating Three-Way Joins with the ON Clause

A three-way join is a join of three tables. In SQL:1999—compliant syntax, joins are performed from left to right. So, the first join to be performed is EMPLOYEES JOIN DEPARTMENTS. The first join condition can reference columns in EMPLOYEES and DEPARTMENTS but cannot reference columns in LOCATIONS. The second join condition can reference columns from all three tables.

Note: The code example in the slide can also be accomplished with the USING clause:

```
SELECT e.employee_id, l.city, d.department_name
FROM employees e
JOIN departments d
USING (department_id)
JOIN locations l
USING (location_id)
```

Applying Additional Conditions to a Join

Use the AND clause or the WHERE clause to apply additional conditions:

Or

```
SELECT e.employee_id, e.last_name, e.department_id, d.department_id, d.location_id

FROM employees e JOIN departments d
ON (e.department_id = d.department_id)

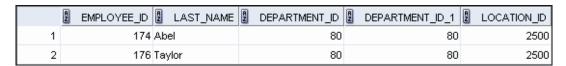

WHERE e.manager_id = 149 ;
```

6 - 18 Copyright © 2007, Oracle. All rights reserved.

Applying Additional Conditions to a Join

You can apply additional conditions to the join.

The example shown performs a join on the EMPLOYEES and DEPARTMENTS tables and, in addition, displays only employees who have a manager ID of 149. To add additional conditions to the ON clause, you can add AND clauses. Alternatively, you can use a WHERE clause to apply additional conditions.

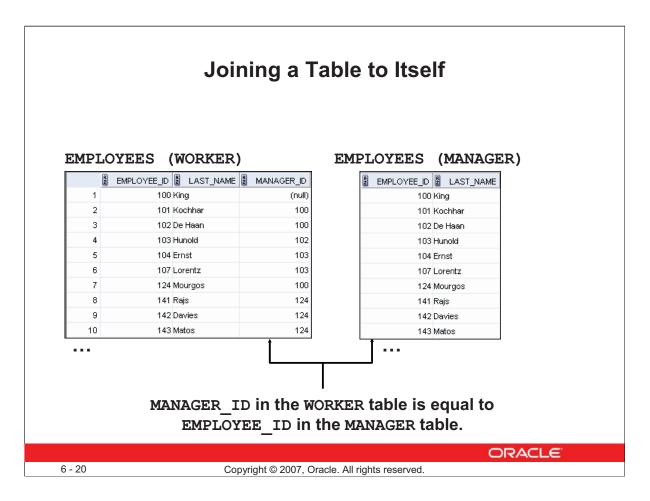

Lesson Agenda

- Types of JOINS and its syntax
- Natural join:
 - USING clause
 - ON clause
- Self-join
- Nonequijoins
- OUTER join:
 - LEFT OUTER join
 - RIGHT OUTER join
 - FULL OUTER join
- Cartesian product
 - Cross join

ORACLE

6 - 19

Copyright © 2007, Oracle. All rights reserved.

Joining a Table to Itself

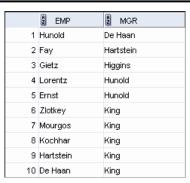

Sometimes you need to join a table to itself. To find the name of each employee's manager, you need to join the EMPLOYEES table to itself, or perform a self-join. For example, to find the name of Lorentz's manager, you need to:

- Find Lorentz in the EMPLOYEES table by looking at the LAST NAME column
- Find the manager number for Lorentz by looking at the MANAGER_ID column. Lorentz's manager number is 103.
- Find the name of the manager with EMPLOYEE_ID 103 by looking at the LAST_NAME column. Hunold's employee number is 103, so Hunold is Lorentz's manager.

In this process, you look in the table twice. The first time you look in the table to find Lorentz in the LAST_NAME column and the MANAGER_ID value of 103. The second time you look in the EMPLOYEE ID column to find 103 and the LAST NAME column to find Hunold.

Self-Joins Using the ON Clause

SELECT worker.last_name emp, manager.last_name mgr
FROM employees worker JOIN employees manager
ON (worker.manager_id = manager.employee_id);

. . .

- 21 Copyright © 2007, Oracle. All rights reserved.

Self-Joins Using the ON Clause

The ON clause can also be used to join columns that have different names, within the same table or in a different table.

ORACLE

The example shown is a self-join of the EMPLOYEES table, based on the EMPLOYEE_ID and MANAGER ID columns.

Note: The parenthesis around the joined columns as in the slide example, (e.manager_id = m.employee id) is optional. So, even ON e.manager id = m.employee id will work.

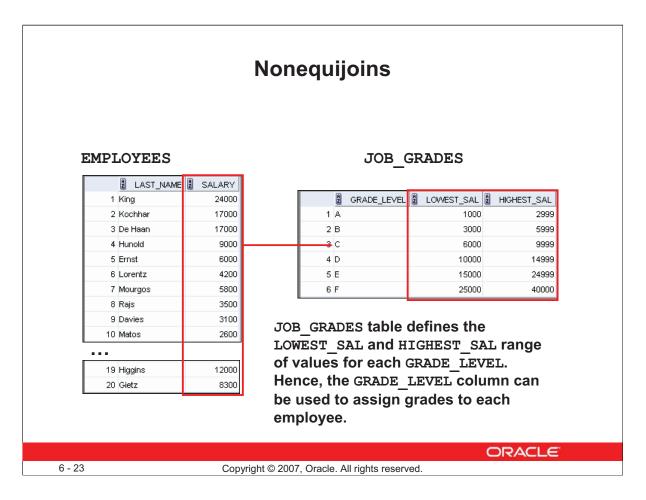

Lesson Agenda

- Types of JOINS and its syntax
- Natural join:
 - USING clause
 - ON clause
- Self-join
- Nonequijoins
- OUTER join:
 - LEFT OUTER join
 - RIGHT OUTER join
 - FULL OUTER join
- Cartesian product
 - Cross join

Nonequijoins

A nonequijoin is a join condition containing something other than an equality operator.

The relationship between the EMPLOYEES table and the JOB_GRADES table is an example of a nonequijoin. The SALARY column in the EMPLOYEES table ranges between the values in the LOWEST_SAL and HIGHEST_SAL columns of the JOB_GRADES table. Hence, each employee can be graded based on their salary. The relationship is obtained using an operator other than the equality (=) operator.

Retrieving Records with Nonequijoins

The slide example creates a nonequijoin to evaluate an employee's salary grade. The salary must be *between* any pair of the low and high salary ranges.

It is important to note that all employees appear exactly once when this query is executed. No employee is repeated in the list. There are two reasons for this:

- None of the rows in the JOB_GRADES table contain grades that overlap. That is, the salary value for an employee can lie only between the low salary and high salary values of one of the rows in the salary grade table.
- All of the employees' salaries lie within the limits provided by the job grade table. That is, no employee earns less than the lowest value contained in the LOWEST_SAL column or more than the highest value contained in the HIGHEST SAL column.

Note: Other conditions (such as <= and >=) can be used, but BETWEEN is the simplest. Remember to specify the low value first and the high value last when using the BETWEEN condition. The Oracle server translates the BETWEEN condition to a pair of AND conditions. Therefore, using BETWEEN has no performance benefits, but should be used only for logical simplicity.

Table aliases have been specified in the slide example for performance reasons, not because of possible ambiguity.

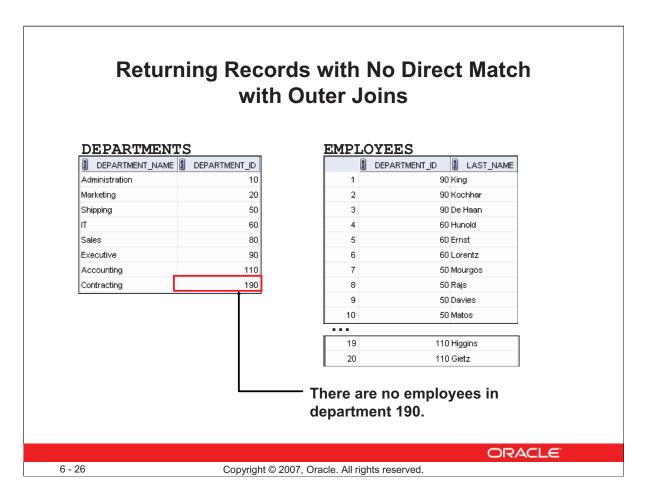

Lesson Agenda

- Types of JOINS and its syntax
- Natural join:
 - USING clause
 - ON clause
- Self-join
- Nonequijoins
- OUTER join:
 - LEFT OUTER join
 - RIGHT OUTER join
 - FULL OUTER join
- Cartesian product
 - Cross join

ORACLE

6 - 25

Copyright © 2007, Oracle. All rights reserved.

Returning Records with No Direct Match with Outer Joins

If a row does not satisfy a join condition, the row does not appear in the query result. For example, in the equijoin condition of EMPLOYEES and DEPARTMENTS tables, department ID 190 does not appear because there are no employees with that department ID recorded in the EMPLOYEES table. Therefore, instead of seeing 20 employees in the result set, you see 19 records.

To return the department record that does not have any employees, you can use an outer join.

INNER Versus OUTER Joins

- In SQL:1999, the join of two tables returning only matched rows is called an inner join.
- A join between two tables that returns the results of the inner join as well as the unmatched rows from the left (or right) table is called a left (or right) outer join.
- A join between two tables that returns the results of an inner join as well as the results of a left and right join is a full outer join.

ORACLE

6 - 27

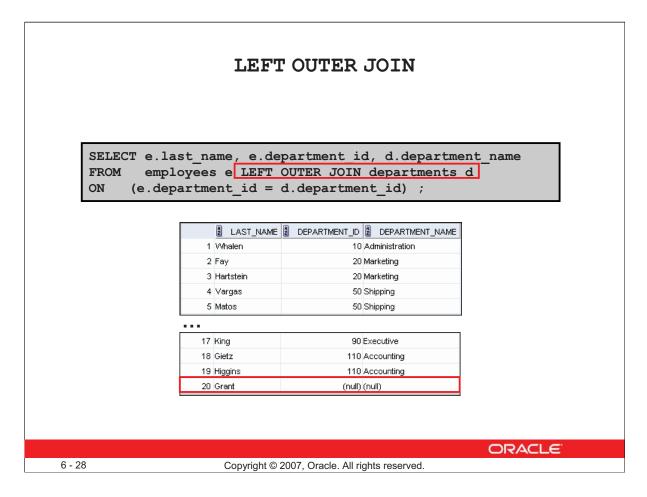

Copyright © 2007, Oracle. All rights reserved.

INNER Versus OUTER Joins

Joining tables with the NATURAL JOIN, USING, or ON clauses results in an inner join. Any unmatched rows are not displayed in the output. To return the unmatched rows, you can use an outer join. An outer join returns all rows that satisfy the join condition and also returns some or all of those rows from one table for which no rows from the other table satisfy the join condition.

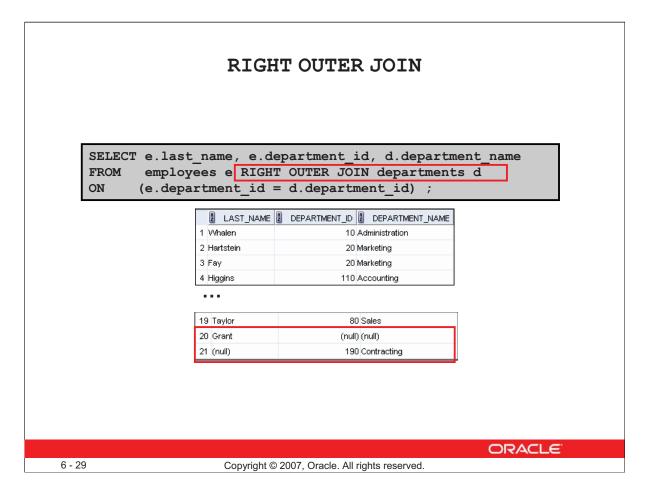

There are three types of outer joins:

- LEFT OUTER
- · RIGHT OUTER
- FULL OUTER

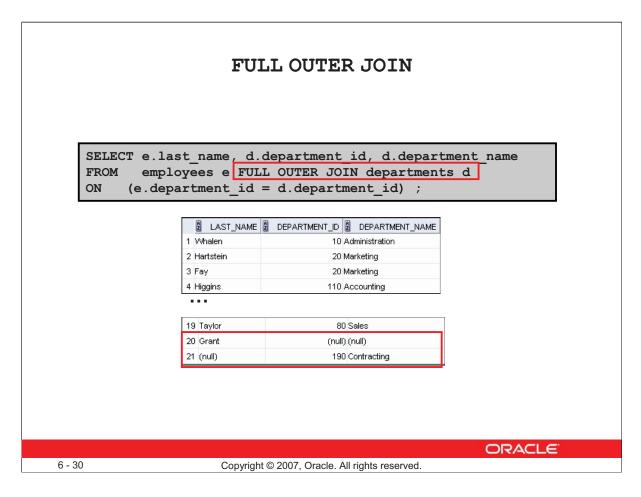

LEFT OUTER JOIN

This query retrieves all rows in the EMPLOYEES table, which is the left table, even if there is no match in the DEPARTMENTS table.

RIGHT OUTER JOIN

This query retrieves all rows in the DEPARTMENTS table, which is the right table, even if there is no match in the EMPLOYEES table.

FULL OUTER JOIN

This query retrieves all rows in the EMPLOYEES table, even if there is no match in the DEPARTMENTS table. It also retrieves all rows in the DEPARTMENTS table, even if there is no match in the EMPLOYEES table.

Lesson Agenda

- Types of JOINS and its syntax
- Natural join:
 - USING clause
 - ON clause
- Self-join
- Nonequiijoin
- OUTER join:
 - LEFT OUTER join
 - RIGHT OUTER join
 - FULL OUTER join
- Cartesian product
 - Cross join

ORACLE

6 - 31

Copyright © 2007, Oracle. All rights reserved.

Cartesian Products

- A Cartesian product is formed when:
 - A join condition is omitted
 - A join condition is invalid
 - All rows in the first table are joined to all rows in the second table
- To avoid a Cartesian product, always include a valid join condition.

ORACLE

6 - 32

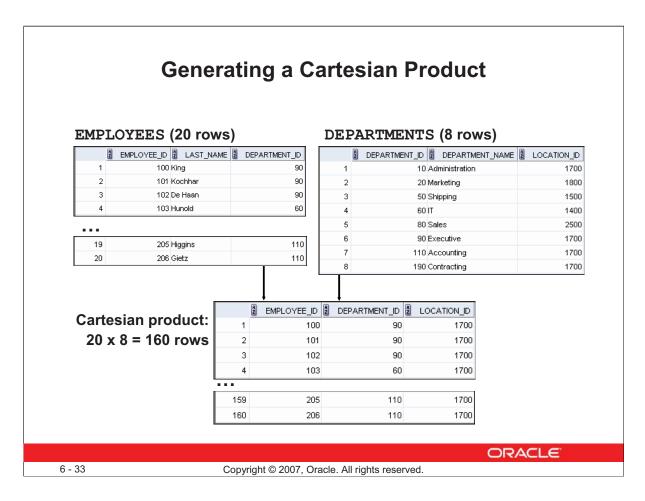

Copyright © 2007, Oracle. All rights reserved.

Cartesian Products

When a join condition is invalid or omitted completely, the result is a *Cartesian product*, in which all combinations of rows are displayed. All rows in the first table are joined to all rows in the second table.

A Cartesian product tends to generate a large number of rows and the result is rarely useful. You should, therefore, always include a valid join condition unless you have a specific need to combine all rows from all tables.

However, Cartesian products are useful for some tests when you need to generate a large number of rows to simulate a reasonable amount of data.

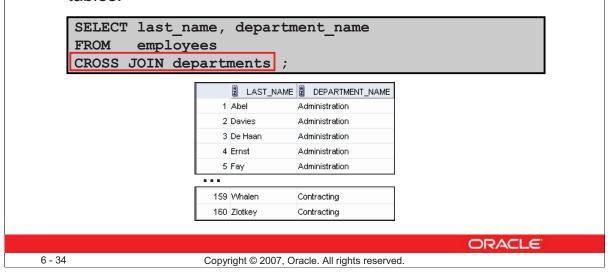

Generating a Cartesian Product

A Cartesian product is generated if a join condition is omitted. The example in the slide displays the employee last name and the department name from the EMPLOYEES and DEPARTMENTS tables. Because no join condition was specified, all rows (20 rows) from the EMPLOYEES table are joined with all rows (8 rows) in the DEPARTMENTS table, thereby generating 160 rows in the output.

Creating Cross Joins

- The CROSS JOIN clause produces the cross-product of two tables.
- This is also called a Cartesian product between the two tables.

Creating Cross Joins

The example in the slide produces a Cartesian product of the EMPLOYEES and DEPARTMENTS tables.

Summary

In this lesson, you should have learned how to use joins to display data from multiple tables by using:

- Equijoins
- Nonequijoins
- Outer joins
- · Self-joins
- Cross joins
- Natural joins
- · Full (or two-sided) outer joins

ORACLE

6 - 35

Copyright © 2007, Oracle. All rights reserved.

Summary

There are multiple ways to join tables.

Types of Joins

- Equijoins
- Nonequijoins
- · Outer joins
- · Self-joins
- Cross joins
- · Natural joins
- Full (or two-sided) outer joins

Cartesian Products

A Cartesian product results in the display of all combinations of rows. This is done by either omitting the WHERE clause or by specifying the CROSS JOIN clause.

Table Aliases

- Table aliases speed up database access.
- Table aliases can help to keep SQL code smaller by conserving memory.
- Table aliases are sometimes mandatory to avoid column ambiguity.

Practice 6: Overview

This practice covers the following topics:

- Joining tables using an equijoin
- Performing outer and self-joins
- Adding conditions

6 - 36 Copyright © 2007, Oracle. All rights reserved.

Practice 6: Overview

This practice is intended to give you experience in extracting data from more than one table using the SQL:1999–compliant joins.

Practice 6

1. Write a query for the HR department to produce the addresses of all the departments. Use the LOCATIONS and COUNTRIES tables. Show the location ID, street address, city, state or province, and country in the output. Use a NATURAL JOIN to produce the results.

	2 LOC	ATION_ID	STREET_ADDRESS	2 CITY	STATE_PROVINCE	2 COUNTRY_NAME
1		1400 2	014 Jabberwocky Rd	Southlake	Texas	United States of America
2		1500 2	011 Interiors Blvd	South San Francisco	California	United States of America
3		1700 2	004 Charade Rd	Seattle	Washington	United States of America
4		1800 4	60 Bloor St. W.	Toronto	Ontario	Canada
5		2500 M	flagdalen Centre, The	Oxford	Oxford	United Kingdom

2. The HR department needs a report of all employees. Write a query to display the last name, department number, and department name for all the employees.

	LAST_NAME	DEPARTMENT_ID	DEPARTMENT_NAME	
1	Whalen	10	Administration	
2	Hartstein	20	Marketing	
3	Fay	20	Marketing	
4	Davies	50	Shipping	
5	Vargas	50	Shipping	
6	Rajs	50	Shipping	
7	Mourgos	50	Shipping	
8	Matos	50	Shipping	
9	Hunold	60	IT	
10	Ernst	60	IT	

- - -

18 Higgins	110 Accounting
19 Gietz	110 Accounting

3. The HR department needs a report of employees in Toronto. Display the last name, job, department number, and the department name for all employees who work in Toronto.

4. Create a report to display employees' last name and employee number along with their manager's last name and manager number. Label the columns Employee, Emp#, Manager, and Mgr#, respectively. Save your SQL statement as lab_06_04.sql. Run the query.

	Employee	B EMP#	2 Manager	2 Mgr#
1	Kochhar	101	King	100
2	De Haan	102	King	100
3	Hunold	103	De Haan	102
4	Ernst	104	Hunold	103
5	Lorentz	107	Hunold	103
6	Mourgos	124	King	100
7	Rajs	141	Mourgos	124
8	Davies	142	Mourgos	124
9	Matos	143	Mourgos	124
10	Vargas	144	Mourgos	124

. . .

15 Whalen	200 Kochhar	101
16 Hartstein	201 King	100
17 Fay	202 Hartstein	201
18 Higgins	205 Kochhar	101
19 Gietz	206 Higgins	205

5. Modify lab_06_04.sql to display all employees including King, who has no manager. Order the results by the employee number. Save your SQL statement as lab_06_05.sql. Run the query in lab_06_05.sql.

	Employee	EMP#	Manager	2 Mgr#
1	King	100	(null)	(null)
2	Kochhar	101	King	100
3	De Haan	102	King	100
4	Hunold	103	De Haan	102
5	Ernst	104	Hunold	103
6	Lorentz	107	Hunold	103
7	Mourgos	124	King	100
8	Rajs	141	Mourgos	124
9	Davies	142	Mourgos	124
10	Matos	143	Mourgos	124

- - -

18 Fay	202 Hartstein	201
19 Higgins	205 Kochhar	101
20 Gietz	206 Higgins	205

6. Create a report for the HR department that displays employee last names, department numbers, and all the employees who work in the same department as a given employee. Give each column an appropriate label. Save the script to a file named lab_06_06.sql.

	A	DEPARTMENT	A	EMPLOYEE	A	COLLEAGUE
1		20	Fay		Har	tstein
2		20	Har	tstein	Fay	,
3		50	Dav	ries	Mat	os
4		50	Dav	ries	Μοι	urgos
5		50	Dav	ries	Raj	S
6		50	Dav	ries	Var	gas
7		50	Mat	os	Dav	/ies
8		50	Mat	os	Μοι	urgos
9		50	Mat	os	Raj	S
10		50	Mat	os	Var	gas
•••						
42		110	Higg	gins	Gie	tz

7. The HR department needs a report on job grades and salaries. To familiarize yourself with the JOB_GRADES table, first show the structure of the JOB_GRADES table. Then create a query that displays the name, job, department name, salary, and grade for all employees.

DESC JOB_GRADES		
Name	Null	Туре
GRADE_LEVEL		VARCHAR2(3)
LOWEST_SAL		NUMBER
HIGHEST_SAL		NUMBER
3 rows selected		

	LAST_NAME	JOB_ID	DEPARTMENT_NAME	2 SALARY 2	GRADE_LEVEL
1	Vargas	ST_CLERK	Shipping	2500 A	
2	Matos	ST_CLERK	Shipping	2600 A	
3	Davies	ST_CLERK	Shipping	3100 B

If you want an extra challenge, complete the following exercises:

8. The HR department wants to determine the names of all the employees who were hired after Davies. Create a query to display the name and hire date of any employee hired after employee Davies.

9. The HR department needs to find the names and hire dates of all the employees who were hired before their managers, along with their managers' names and hire dates. Save the script to a file named lab 06 09.sql.
